

Duplex filter with filter element according to DIN 24550

Type 63FLDKN0063 to 0250;
63FLDK0130, 0150

RE 51445

Edition: 2021-04

Replaces: -

- ▶ Size **according to DIN 24550**: 0063 to 0250
- ▶ Additional sizes: 0130, 0150
- ▶ Nominal pressure 63 bar [913 psi]
- ▶ Connection up to SAE 2" 3000 psi
- ▶ Operating temperature $-10\text{ }^{\circ}\text{C}$ to $+100\text{ }^{\circ}\text{C}$ [$14\text{ }^{\circ}\text{F}$ to $212\text{ }^{\circ}\text{F}$]

Features

Duplex filters are used in hydraulic systems for separating solid materials from fluids and lubricating oils.

They are intended for installation into pipelines and allow for the exchange of the filter element without operational interruption.

They distinguish themselves by the following:

- ▶ Filters for inline installation, switchable
- ▶ Special highly efficient filter materials
- ▶ Filtration of very fine particles and high dirt holding capacity across a broad pressure differential range
- ▶ High collapse rating of the filter elements
- ▶ By default equipped with mechanical optical maintenance indicator with memory function
- ▶ Various, optional electronic switching elements, modular design
- ▶ Optional bypass valve integrated in the filter housing
- ▶ Measuring port as standard at the switch housing
- ▶ Gas-tight switch-over via ball valve
- ▶ Improved filtration through integrated cyclone flow path

Filter design

Easy selection of the filter size is made possible by the FilterSelect online tool. The filter can be designed using the operating pressure, flow and fluid system parameters. The required filter rating is based on the application, the sensitivity to contamination of the components and the environmental conditions.

The program leads you through the menu on a step-by-step basis.

A documentation of the filter selection can finally be created in the form of a PDF file. This file contains the entered parameters, the designed filter with material number including spare parts, and the pressure loss curves.

Function, section

The 63FLDK(N) duplex filter is suitable for inline installation.

It basically consists of two filter housings (2) with switch-over fitting (1), a threaded filter cover (3), filter element (4) as well as mechanical optical maintenance indicator (11).

Via the inlet, the hydraulic fluid reaches the filter element (4) where it is cleaned. The dirt particles filtered out collect in the filter element (4) and in the filter housing (2). Via the outlet, the filtered fluid enters the hydraulic circuit.

By means of the switching lever, you can switch between the two filter housings without operational interruption.

The filter housing and all connection elements are designed so that pressure peaks - as they may e.g. occur in case of abrupt opening of large control valves due to the accelerated fluid quantity - can be securely absorbed. One magnetic screw (8) is included in the standard equipment. The magnetic screw only collects magnetic contamination particles.

Via the bleed screws (standard) and/or bleed valves - amending ordering code E (7) -, the filter side to be maintained can be bled. The measuring ports (9) at the side of the connection flange are drilled as standard. Optionally, threaded couplings - amending ordering code M - can be ordered.

As an option, the filter is available with a base - amending ordering code FB - (10). The optional pressure equalization line (13) serves to simplify the filling and bleeding in a filter element exchange. The pressure equalization line is necessary in order to prevent unwanted aeration.

By default, the filter is equipped with mechanical optical maintenance indicator (11). The electronic switching element (12) which has to be ordered separately is attached to the mechanical optical maintenance indicator (11) and held by means of a locking ring.

The electronic switching elements with 1 or 2 switching points are connected via a mating connector according to IEC-60947-5-2 or via a cable connection according to EN17301-803.

- 5 Draining dirt side
- 6 Draining clean side

WARNING!

If the maintenance indicator is ignored when an element change is required, there is the possibility the filter will go into bypass and contaminated oil will pass to the clean side of the filter outlet. Therefore the filtration effectiveness is no longer guaranteed.

Important information on hydraulic fluids!

- For more information and data on the use of other hydraulic fluids, please refer to data sheet 90220 or contact us.
- **Flame-resistant - containing water:** Due to possible chemical reactions with materials or surface coatings of machine and system components, the service life with these hydraulic fluids may be less than expected. Filter materials made of

filter paper P... (cellulose) may not be used, filter elements with glass fiber material (HydroClean PWR... or wire mesh G) have to be used instead.

- **Bio-degradable:** If filter materials made of filter paper are used, the filter life may be shorter than expected due to material incompatibility and swelling.

Notice:

Seals of the switch-over are not included in the filter seal kit. In case of leakage at the switch-over, please contact the Hengst Service.

Assembly, commissioning, maintenance

Assembly

The max. operating pressure of the system must not exceed the max. admissible. Do not exceed the operating pressure of the filter (see name plate).

In the assembly, you have to distinguish between floor mounting and wall mounting.

During assembly of the filter (see also chapter "Tightening torques"), the flow direction (direction arrows) and the required servicing height of the filter element (see chapter "Dimensions") are to be considered. The filter cover may be used as lifting point.

(See information on the name plate).

Proper function is only guaranteed in the installation position filter cover vertically upwards. The maintenance indicator must be arranged so it is easily viewed in operation.

Remove the plastic plugs in the filter inlet and outlet.

Ensure that the system is assembled without tension stress.

The optional electronic maintenance indicator is connected via the electronic switching element with 1 or 2 switching points, which is attached to the mechanical optical maintenance indicator and held by means of the locking ring.

Commissioning

Bring the switching lever into central position in order to fill both filter sides.

Start the system.

Bleed filter by opening the bleed screws or bleed valves, close when operating liquid begins to escape.

Switch the filter into the operating position; to do so, switch the switching lever to one of the two end positions. (See information on the name plate).

The switch-over lever is on the filter side that is in operation.

Open the optional pressure equalization line.

Maintenance

- ▶ If at operating temperature, the red indicator pin reaches out of the mechanical optical maintenance indicator and/or if the electronic switching element opens/closes the circuit, the filter element is contaminated and needs to be replaced or cleaned respectively.
- ▶ The material number of the corresponding replacement filter element is indicated on the name plate of the complete filter.

It must correspond to with the material number on the filter element.

- ▶ The switch-over lever is on the filter side that is in operation. (See information on the name plate).
- ▶ Switch the filter over.
- ▶ Close the optional pressure equalization valve.
- ▶ Open the bleed screw or bleed valve at the decommissioned filter side in order to reduce the pressure.
- ▶ Via the drain screw, the oil on the dirt side can be drained.
- ▶ Unscrew the filter cover of the filter side that is not in operation.
- ▶ Remove the filter element from the spigot by rotating it slightly.
- ▶ Where appropriate, remove the magnetic screw and check it for magnetic residue.
- ▶ Clean the filter components, if necessary.
- ▶ Check the seals for damage and replace them, if necessary.
For suitable seal kits refer to chapter "Spare parts".
- ▶ Filter elements made of wire mesh can be cleaned.
For detailed cleaning instructions refer to data sheet 51420.
- ▶ Install the new or cleaned filter element on the spigot again by slightly rotating it.
- ▶ The filter is to be assembled in reverse order.
- ▶ The torque specifications ("Tightening torques" chapter) are to be observed.

Moreover required for filters with pressure equalization line (optional)

- ▶ To fill the maintained filter side, open the pressure equalization line.
- ▶ The filter is bled via the bleed screw or the bleed valve which is still open.
- ▶ After fluid escapes, close the bleed screw or the bleed valve again.
- ▶ Ensure correct position of the switch-over lever end position.
- ▶ The pressure equalization valve should remain open.

Notice:

The switch over ball valve may only be disassembled by Hengst service personnel.

Assembly, commissioning, maintenance

Correct position of the switching lever during filter element exchange

WARNINGS!

- ▶ Assemble and disassemble only with depressurized system! For the filter element exchange refer to "Maintenance".
- ▶ Tank is pressurized!
- ▶ All works at the filter only be trained specialists.
- ▶ Remove the filter cover only if it is depressurized!
- ▶ Do not exchange the optical/mechanical maintenance indicator while the filter is under pressure!
- ▶ Do not operate the switching lever and the optional pressure equalization valve during the filter element exchange.

- ▶ When disassembling the filter, it has to be ensured that the system is depressurized.
- ▶ Warranty is only guaranteed if original Hengst filter elements and spare parts are used.
- ▶ Warranty becomes void if the delivered item is changed by the ordering party or third parties or improperly mounted, installed, maintained, repaired, used or exposed to environmental conditions that do not comply with the installation conditions.

Directives and standardization

Product validation

Hengst filters, the filter elements built into them and filter accessories are tested and quality-monitored according to different ISO test standards:

Pressure pulse test	ISO 10771:2015-08
Filtration performance test (multipass test)	ISO 16889:2008-06
Δp (pressure loss) characteristic curves	ISO 3968:2001-12
Compatibility with hydraulic fluid	ISO 2943:1998-11
Collapse pressure test	ISO 2941:2009-04

The development, manufacture and assembly of Hengst industrial filters and Hengst filter elements is carried out within the framework of a certified quality management system in accordance with ISO 9001:2015.

Classification according to the Pressure Equipment Directive

The duplex filters for hydraulic applications according to 51445 are pressure holding equipment according to article 1, section 2.1.4 of the Pressure Equipment Directive 97/23/EC (PED). However, based on the exception in

article 1, section 3.6 of the PED, hydraulic filters are exempt from the PED if they are not classified higher than category I (guideline 1/19).

They do not receive a CE mark.

Use in explosive areas according to directive 94/9/EC (ATEX)

The duplex filters according to 51445 are not equipment or components in the sense of directive 94/9/EC and are not provided with a CE mark. It has been proven with the ignition risk analysis that these inline filters do not have own ignition sources acc. to DIN EN 13463-1:2009.

According to DIN EN 60079-11:2012, the electronic maintenance indicators WE-1SP-M12x1 and WE-1SP-EN175301-803 are simple, electronic operating equipment not having an own voltage source. This simple, electronic operating equipment may - according to DIN EN 60079-14:2012 - in intrinsi-

cally safe electric circuits (Ex ib) be used in systems without marking and certification.

The duplex filters and the electronic maintenance indicators described here can be used for the following explosive areas:

	Zone suitability	
Gas	1	2
Dust	21	22

Dust accumulation		Max	–
			0.5 mm

¹⁾ The temperature depends on the temperature of the medium in the filter and must not exceed the value specified here.

Possible circuit according to DIN EN 60079-14

⚠ WARNING!

- ▶ Explosion hazard due to high temperature!
The temperature depends on the temperature of the medium in the hydraulic circuit and must not exceed the value specified here. Measures are to be taken so that in the explosive area, the max. admissible ignition temperature is not exceeded.
- ▶ When using the duplex filters according to 51445 in explosive areas, sufficient potential equalization has to be ensured. The filter is preferably to be grounded via the mounting screws.

It has to be noted in this connection that paintings and oxidic protective layers are not electrically conductive.

- ▶ Maintenance only by specialists, instruction by the machine end-user acc. to DIRECTIVE 1999/92/EC appendix II, section 1.1
- ▶ During filter element exchanges, the packaging material is to be removed from the replacement element outside the explosive area
- ▶ Functional and safety warranty only applicable when using genuine Hengst spare parts
